

PIPELINE MAPPING SERVICES

Pipeline Mapping at Facilities

Utilizing cutting-edge electromagnetic locator technology, Diakont delivers industry-leading pipeline location mapping services. Diakont's pipeline mapping services provide XYZ positional data on the precise locations of pipelines in latitude, longitude, and elevation. This service is invaluable for facilities looking to verify existing drawings, and to fill in data gaps for newly acquired assets. Furthermore, Diakont uses above ground electromagnetic technology, eliminating the need for excavation.

Based on the geospatial data with GPS mapping, Diakont provides 3D drawings of piping systems overlaid on top of satellite images. With this highly accurate pipeline mapping, facility operators will know the exact location of piping systems based on GPS coordinates and relative position compared to physical landmarks such as storage tanks, valves, etc. The 3D drawings also provide depth of piping systems which is essential for avoiding catastrophes during excavation or new equipment installations.

Pipeline Services Expertise

Diakont's expert teams of project managers, engineers and field technicians are highly trained for working on facilities and have successfully completed projects for over 50 facilities and stations. Diakont also provides comprehensive pipeline inspection services of buried piping to ensure facilities operate safely and efficiently.

Call Diakont today to schedule a review of your buried pipeline mapping needs (858) 551-5551.
